PROFESSIONAL SUMMARY

Computer Engineering student passionate about front-end engineering, building fast, responsive, component-driven interfaces with React, Next.js, and TypeScript. Comfortable across the stack with Java, Spring Boot, and Node.js/Express. Seeking a front-end or full-stack internship to contribute and grow on a production team.

TECHNICAL SKILLS

Frontend: React.js, Next.js, JavaScript (ES6+), TypeScript, Tailwind CSS, CSS3, HTML5, Vite, React Hooks, Component-Based Architecture, State Management, Responsive and Mobile-First Design, REST API Integration

Backend: Java, Spring Boot, Node.js, Express.js, RESTful APIs, Spring Validation, JWT Authentication

Databases and Tools: PostgreSQL, SQL, Docker, Git, GitHub, Maven, npm, Postman, IntelliJ IDEA, VS Code

FEATURED PROJECTS

MovieTracker Web Application

React, TMDb API, Vite, CSS3 | Link: <https://eghesmati.github.io/MovieTracker>

- Architected a responsive single-page application in React using functional components and custom hooks (useState, useEffect) to manage complex, real-time UI state.
- Built a mobile-first, cross-browser interface with hand-tuned CSS3 layout and optimized rendering for smooth performance on all devices.
- Integrated the TMDb REST API through asynchronous Fetch pipelines to power live search, dynamic poster rendering, and metadata discovery with a polished user experience.

Notes and Productivity Platform

PERN Stack (React, Node, Express, PostgreSQL), JWT Authentication | Link: <https://github.com/EGhesmati/Notes>

- Designed and built modular, reusable React components driving real-time CRUD note management and an interactive Pomodoro timer with dynamic state transitions.
- Developed an interactive front-end time-analytics dashboard, translating SQL aggregations into clear, responsive data visualizations for tracking productivity metrics.
- Implemented secure client-side JWT authentication flows and protected routing, backed by normalized PostgreSQL schemas on the Express/Node API layer.

Product Catalog REST API

Java, Spring Boot, Maven | Link: <https://github.com/EGhesmati/product-catalog-api>

- Architected a thread-safe RESTful API with a clean 3-tier (Controller-Service-Repository) architecture and DTO request/response separation to support a front-end client.
- Applied Spring Validation and global error handling to standardize JSON responses consumed by client applications.
